AI CHILDREN’S STORY WITH AI ILLUSTRATIONS

Project Report

A simple interactive website that helps children explore imaginative stories through themes such as magical forests, space adventures, friendly animals, and fairy-tale kingdoms.

Project Domain	Web Development / Educational Technology
Technologies	HTML, CSS, JavaScript (prototype)
Prepared by	Name: _____
Department / College	_____
Academic Year	2026–2027

1. Abstract

AI Children’s Story with AI Illustrations is an educational web-project concept designed to make reading creative, enjoyable, and interactive for children. The user enters a child’s name, selects a story theme, and receives a short story. The project can be extended with an AI text-generation service and an image-generation service to create original story scenes and illustrations.

The current prototype is built with HTML, CSS, and JavaScript. It demonstrates the user interface and theme-based story generation directly in the browser. It does not call an external AI service yet; therefore, the stories are selected from predefined templates. This report explains the objectives, system design, implementation, testing, limitations, and future enhancements.

2. Introduction

Stories help children develop imagination, language, empathy, and curiosity. However, a single printed story may not match every child’s interests. A digital story creator can offer different themes and a more personal experience. By adding illustrations, the project can also support visual learning and help young readers connect story events with characters and places.

Problem statement

Children may find generic reading material less engaging. Creating a personalized story and matching illustrations manually can take time. This project proposes a simple website where users can select a theme and quickly view a child-friendly story.

Proposed solution

Provide an easy interface with a name field, theme selector, and Generate Story button. Display the resulting story in a readable format, with future integration planned for AI-generated story text and illustrations.

3. Objectives and Scope

Objectives

• Create a simple and responsive interface that is easy for beginners to use.

• Allow users to personalize a story with a child's name.

• Offer multiple themes, including a magical forest, space adventure, friendly animals, and a princess adventure.

• Demonstrate story generation using JavaScript.

• Provide a foundation for integrating AI-written stories and AI-generated illustrations in a later version.

Scope

The prototype is suitable for a classroom demonstration and basic web-development project. It works in a modern browser and does not require a database for its current features. The first version focuses on story selection and display. AI services, user accounts, saved stories, audio narration, and downloadable illustrated books are outside the current implementation and are listed as future enhancements.

Target users

Children with adult guidance, parents, teachers, and students who want to explore creative storytelling and basic web technologies.

4. Tools and Technologies

Technology	Purpose
HTML5	Creates the page structure, input field, selector, button, and story area.
CSS3	Controls colours, spacing, layout, typography, and visual presentation.
JavaScript	Reads user input, selects the theme, and displays the story.
Web browser	Runs the website locally on a phone or computer.
AI services (future)	Can generate fresh story text and matching illustrations through an API.

5. System Design

Workflow

1. Enter name	2. Choose theme	3. Generate	4. Read story
User types a name or leaves it blank.	Selects a theme from the list.	JavaScript selects a matching story template.	The story appears on the page.

Main modules

• **User interface:** collects the child's name and selected theme.

• **Story logic:** chooses a predefined story based on the selected theme.

• **Output display:** presents the story in a dedicated area.

• **Illustration extension:** a future module can request an image for each scene from an image-generation API.

Illustration plan

For an AI-enabled version, the application can send a safe, age-appropriate scene description to an image-generation service. For example, a magical forest scene could show friendly animals, glowing flowers, and a child-friendly fantasy setting. The returned image would be displayed beside the corresponding story section. API keys must be stored on a secure server and must not be placed directly in public browser code.

6. Functional Requirements

• The page must load in a modern browser.

• The user can enter a name.

• The user can select one of the available themes.

• Clicking Generate Story displays a story that matches the theme.

• If the name field is empty, the application uses a default name.

• The story text should be readable on mobile and desktop screens.

7. Implementation

Create a file named **index.html**. The following simplified example shows the main JavaScript logic. The full page also includes HTML elements and CSS styling.

```
function createStory() {
  let name = document.getElementById("name").value.trim();
  let theme = document.getElementById("theme").value;

  if (name === "") {
    name = "Little Star";
  }

  let story = "";

  if (theme === "forest") {
    story = name + " entered a magical forest and helped its animals.";
  } else if (theme === "space") {
    story = name + " travelled through space and helped a friendly alien.";
  } else if (theme === "animals") {
    story = name + " and some animal friends helped a baby bird.";
  } else {
    story = name + " found a missing star and helped a kingdom.";
  }

  document.getElementById("story").textContent = story;
}
```

How the code works

• The function runs when the Generate Story button is clicked.

• The name and selected theme are read from the page.

• A default name is used if the input is empty.

• An if/else-if structure chooses the story that matches the theme.

• The textContent property displays the story safely as text.

How to run the prototype

• Save the complete website code as index.html.

• Open the file in a modern web browser, or upload it to a GitHub repository.

• Enter a name, select a theme, and tap Generate Story.

• Test each theme to confirm that the displayed story changes.

Note: The complete prototype provided separately contains the CSS and the full story text. This report includes a shorter code excerpt to explain the main logic.

8. Sample Story and Illustration Concept

Sample theme: Magical Forest

Once upon a time, **Little Star** walked into a magical forest. The trees shimmered in the morning sunlight, and colourful butterflies danced above the flowers. A tiny fairy asked Little Star to help a rabbit find its way home. Together, they followed a trail of glowing leaves and found the rabbit's family near a sparkling stream. The forest animals thanked Little Star with a celebration full of music and laughter. Little Star learned that kindness can make an ordinary day magical.

Illustration storyboard

Scene 1	Scene 2	Scene 3
A child entering a glowing forest with tall trees and colourful flowers.	A friendly fairy and rabbit beside a path of sparkling leaves.	Forest animals celebrating beside a clear stream.

Illustration prompt example: "A warm, colourful children's book illustration of a friendly magical forest, a smiling child, a tiny fairy, and a rabbit near glowing flowers; gentle lighting, whimsical style, safe for young readers, no text in the image."

In a complete AI-integrated system, a prompt can be created for each story scene and sent to an approved image-generation service. The resulting image should be reviewed for age-appropriateness before display.

9. Testing

Test	Input / Action	Expected result
1	Open index.html	Page loads without errors.
2	Enter "Mia", choose Forest	Forest story includes the name Mia.
3	Choose Space Adventure	Space story appears.
4	Leave name blank	Default name is used.
5	Tap Generate Story	Story area updates.

10. Advantages, Limitations and Safety

Advantages

• Simple and beginner-friendly interface.

• Personalizes the story using the child's name.

• Offers multiple story themes.

• Can be expanded into an illustrated digital storybook.

• Demonstrates core HTML, CSS, and JavaScript concepts.

Current limitations

• The current prototype uses predefined story templates rather than a live AI model.

• It does not yet generate or save images.

• Stories are short and the number of themes is limited.

• There is no database, login system, or cloud storage.

Safety and privacy

A child-focused application should use age-appropriate language and positive themes. Avoid collecting unnecessary personal information. If an external AI service is added, follow its age, privacy, and usage requirements. Keep API keys on a secure server, filter prompts and outputs, and have a responsible adult review generated content. Do not publish private information in a public repository.

11. Future Enhancements

• Integrate an AI text-generation API to create new stories based on a theme and age range.

• Generate a matching illustration for each story scene.

• Add read-aloud audio and simple narration controls.

• Allow users to download or print a storybook as a PDF.

• Add more themes, languages, and accessibility options.

• Store favourite stories only with suitable privacy protections.

12. Conclusion

AI Children's Story with AI Illustrations presents a useful starting point for combining storytelling and web development. The current HTML, CSS, and JavaScript prototype demonstrates personalized, theme-based story display. With secure AI service integration, it can be extended to create original stories and matching illustrations, supporting creativity and enjoyable reading for children.
